

Data Science Cheat Sheet

Pandas

KEY

We'll use shorthand in this cheat sheet

df - A pandas DataFrame object

s - A pandas Series object

IMPORTS

Import these to start

```
import pandas as pd
```

```
import numpy as np
```

IMPORTING DATA

pd.read_csv(filename) - From a CSV file

pd.read_table(filename) - From a delimited text file (like TSV)

pd.read_excel(filename) - From an Excel file

pd.read_sql(query, connection_object) - Reads from a SQL table/database

pd.read_json(json_string) - Reads from a JSON formatted string, URL or file.

pd.read_html(url) - Parses an html URL, string or file and extracts tables to a list of dataframes

pd.read_clipboard() - Takes the contents of your clipboard and passes it to **read_table()**

pd.DataFrame(dict) - From a dict, keys for columns names, values for data as lists

EXPORTING DATA

df.to_csv(filename) - Writes to a CSV file

df.to_excel(filename) - Writes to an Excel file

df.to_sql(table_name, connection_object) - Writes to a SQL table

df.to_json(filename) - Writes to a file in JSON format

df.to_html(filename) - Saves as an HTML table

df.to_clipboard() - Writes to the clipboard

CREATE TEST OBJECTS

Useful for testing

pd.DataFrame(np.random.rand(20,5)) - 5 columns and 20 rows of random floats

pd.Series(my_list) - Creates a series from an iterable **my_list**

df.index = pd.date_range('1900/1/30', periods=df.shape[0]) - Adds a date index

VIEWING/INSPECTING DATA

df.head(n) - First **n** rows of the DataFrame

df.tail(n) - Last **n** rows of the DataFrame

df.shape - Number of rows and columns

df.info() - Index, Datatype and Memory information

df.describe() - Summary statistics for numerical columns

s.value_counts(dropna=False) - Views unique values and counts

df.apply(pd.Series.value_counts) - Unique values and counts for all columns

SELECTION

df[col] - Returns column with label **col** as Series

df[[col1, col2]] - Returns Columns as a new DataFrame

s.iloc[0] - Selection by position

s.loc[0] - Selection by index

df.iloc[0,:] - First row

df.iloc[0,0] - First element of first column

DATA CLEANING

df.columns = ['a','b','c'] - Renames columns

pd.isnull() - Checks for null Values, Returns Boolean Array

pd.notnull() - Opposite of **s.isnull()**

df.dropna() - Drops all rows that contain null values

df.dropna(axis=1) - Drops all columns that contain null values

df.dropna(axis=1, thresh=n) - Drops all rows have have less than **n** non null values

df.fillna(x) - Replaces all null values with **x**

s.fillna(s.mean()) - Replaces all null values with the mean (mean can be replaced with almost any function from the statistics section)

s.astype(float) - Converts the datatype of the series to float

s.replace(1, 'one') - Replaces all values equal to **1** with **'one'**

s.replace([1,3], ['one', 'three']) - Replaces all **1** with **'one'** and **3** with **'three'**

df.rename(columns=lambda x: x + 1) - Mass renaming of columns

df.rename(columns={'old_name': 'new_name'}) - Selective renaming

df.set_index('column_one') - Changes the index

df.rename(index=lambda x: x + 1) - Mass renaming of index

FILTER, SORT, & GROUPBY

df[df[col] > 0.5] - Rows where the **col** column is greater than **0.5**

df[(df[col] > 0.5) & (df[col] < 0.7)] - Rows where **0.7 > col > 0.5**

df.sort_values(col1) - Sorts values by **col1** in ascending order

df.sort_values(col2, ascending=False) - Sorts values by **col2** in descending order

df.sort_values([col1,col2], ascending=[True,False]) - Sorts values by

col1 in ascending order then **col2** in descending order

df.groupby(col) - Returns a groupby object for values from one column

df.groupby([col1,col2]) - Returns a groupby object values from multiple columns

df.groupby(col1)[col2].mean() - Returns the mean of the values in **col2**, grouped by the values in **col1** (mean can be replaced with almost any function from the statistics section)

df.pivot_table(index=col1, values=[col2,col3], aggfunc=mean) - Creates a pivot table that groups by **col1** and calculates the mean of **col2** and **col3**

df.groupby(col1).agg(np.mean) - Finds the average across all columns for every unique column 1 group

df.apply(np.mean) - Applies a function across each column

df.apply(np.max, axis=1) - Applies a function across each row

JOIN/COMBINE

df1.append(df2) - Adds the rows in **df1** to the end of **df2** (columns should be identical)

pd.concat([df1, df2], axis=1) - Adds the columns in **df1** to the end of **df2** (rows should be identical)

df1.join(df2, on=col1, how='inner') - SQL-style joins the columns in **df1** with the columns on **df2** where the rows for **col** have identical values. **how** can be one of **'left', 'right', 'outer', 'inner'**

STATISTICS

These can all be applied to a series as well.

df.describe() - Summary statistics for numerical columns

df.mean() - Returns the mean of all columns

df.corr() - Returns the correlation between columns in a DataFrame

df.count() - Returns the number of non-null values in each DataFrame column

df.max() - Returns the highest value in each column

df.min() - Returns the lowest value in each column

df.median() - Returns the median of each column

df.std() - Returns the standard deviation of each column
